

ABSTRACT OF THE INVENTION

The present invention provides a method for manufacturing a 3D image display body which is used to display 3D images in which right-eye image display parts *a* and left-eye image display parts *b* are mixed, the method having a phase-difference film that is disposed on a transparent support with an adhesive agent interposed. Specified portions of the above-mentioned phase-difference film are then cut away by means of an ultra-hard blade, so that a plurality of grooves that extend from one side of the phase-difference film to the other side are formed side by side in the phase-difference film. A display member is then superimposed on or bonded to the phase-difference film.
